Summary of your appointment on ______________ (date)

Diagnosis after first Stroke Prevention Clinic appointment:
☐ Stroke – Ischemic  ☐ TIA
☐ Stroke - Hemorrhagic  ☐ Unsure if stroke or TIA – further tests needed
☐ Other: _______________________________________________

Medication changes made at my Stroke Prevention Clinic appointment:
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

See pages 18 to 19 for a list of tests ordered. Other tests and referrals:
________________________________________________________________________
________________________________________________________________________

Driving:
☐ You can drive. There are no significant concerns regarding your ability to
   drive at this time.
☐ Stop driving. You will be reassessed by the Stroke Prevention doctor at
   your next appointment to determine if you are able to drive. The Ministry
   of Transportation will be notified.

Follow-up plan:
☒ Family Doctor – Please make an appointment with your family doctor
   within the next 2 weeks
☐ Stroke Prevention Clinic (we will contact you with a date and time)
☐ Other: _______________________________________________

Other instructions:
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

Stroke Prevention Clinic
Your Guide to Stroke and TIA

Contact information

905-521-2100

Stroke Clinic Nurse: Lisa at ext. 46814

Booking Clerk: ext. 44713

You were seen in the Stroke Prevention Clinic because you may
have had a stroke or transient ischemic attack (TIA), also called a
mini stroke. This can be a stressful time for you and you may have
questions about your care. This handout will help to answer some of
those questions.

You will receive a letter in the mail with your follow-up appointment.
These appointments are usually booked within 3 months after your
first visit. If you have any questions in the meantime, or if you have
not received your appointment letter, please call the Stroke Prevention
Clinic at 905-521-2100, ext. 44713.

For more information on stroke and TIA visit the Central South Stroke
Network website at www.csnstroke.ca

Bring this booklet with you to your family
doctor’s appointment and to all of your
Stroke Prevention Clinic appointments.

© Hamilton Health Sciences, 2018

dt/February 5, 2018
We are always looking for ways to prevent strokes and to improve the lives of patients with stroke through research and therefore, a member of the stroke research team may be in contact with you.

Learn more about stroke, TIA and how to reduce your risk at “Stroke Busters” – a free educational session offered each month at the Hamilton General Hospital.

For more information and to register call 905-521-2100, ext. 44713.

What is a stroke?
A stroke happens when blood stops flowing to any part of your brain, damaging brain cells. It is caused by a blockage of blood flow to the brain or the rupture of blood vessels in the brain. The effects of a stroke depend on the part of the brain that was damaged and the amount of damage done.

Types of stroke

Ischemic stroke
This type of stroke is caused by a blockage or clot in a blood vessel in your brain. The blockage can be caused when a substance called plaque builds up on the inside wall of an artery.

Hemorrhagic stroke
This type of stroke is caused when an artery in the brain breaks open. The interrupted blood flow causes damage to your brain.

Transient Ischemic Attack (TIA)
A TIA is caused by a small clot that briefly blocks an artery in the brain. It is sometimes called a mini-stroke or warning stroke. The symptoms of a TIA are similar to a stroke. No lasting damage occurs, but TIAs are an important warning that a more serious stroke may occur soon.

Keep fit
Do some activity every day. It is your best defense against falls.

- Walk. Try Tai Chi. Do what you can to maintain your flexibility and balance.
- Build your muscle and bone strength by doing "resistance" activities or exercises (such as weight lifting).
- Talk to your doctor before starting an exercise program. Have your hearing and vision checked regularly.

Use medication wisely

- If your medication causes dizziness or sleepiness, adjust your activities so you are not at risk of falling.
- Do not mix alcohol and medications. Alone or in combination with medications, alcohol can cause falls.
- See page 8 for more information on medication safety.

Use safety aids

- Wear your glasses and hearing aid.
- Talk to your therapist or family doctor about using a walker or cane. If you use a cane, make sure that it is the correct height and that it is rubber-tipped for safety.
- Wearing the right footwear is important. Comfortable shoes that provide good support can help to prevent falls.
- Find out about other gadgets that can make your life safer. This includes reachers, anti-skid soles, hip protectors, portable phone, or a long handle shoe horn. There are many types of gadgets or devices to help you. Ask your health care provider for more options.

Above definitions reproduced with the permission of the Heart and Stroke Foundation of Canada, 2017. www.heartandstroke.ca
Kitchen

- Store kitchen supplies and pots and pans in easy-to-reach locations.
- Store heavy items in lower cupboards.
- Use a stable step stool with a safety rail for reaching high places.
- Always wipe up any spills right away to prevent slipping.
- If you use floor wax, use the non-skid kind.

Stairs

- Make sure your stairs are well lit.
- Have solid handrails on both sides of the stairway.
- Remove your reading glasses when you go up or down the stairs.
- Never rush up or down the stairs. It is a major cause of falls.

Exterior

- Keep front steps and walkway in good repair and free of snow, ice and leaves.
- Keep front entrance well lit.
- Put gardening tools such as hoses and rakes away when not using them.

Eat healthy meals

- Nutritious meals help keep you strong, fight off colds and flu, and maintain your balance.
- Do not skip meals. It can cause weakness and dizziness.

Learn the signs of stroke

Risk factors for TIA and stroke

Some risk factors are under your control. Check the ones that apply to you.

<table>
<thead>
<tr>
<th>Risk factor</th>
<th>What you can do….</th>
</tr>
</thead>
</table>
| Tobacco use            | ✓ Quit tobacco products. This will help to reduce further plaque build-up in your arteries and will also help to prevent blood from clotting or sticking to the plaque. You are more likely to be successful in quitting smoking if you plan ahead and have support:  
  - Get help and counselling from your health care provider  
  - Make your home and car smoke-free  
  - Use quit smoking medications like the nicotine patches to manage your cravings and withdrawal symptoms  
  ✓ Contact your health care provider or Smokers’ Helpline for support and information on medications to help you quit:  
    - Smokers’ Helpline toll-free at 1-877-513-5333 or [www.smokershelpline.ca](http://www.smokershelpline.ca) |
| High blood pressure   | ✓ Keep your blood pressure in check. High blood pressure is the leading cause of stroke.  
  ✓ Check your blood pressure regularly. Your blood pressure should be less than 140/90, or less than 130/80 if you have diabetes. If your blood pressure is consistently above these numbers, follow up with your family doctor. |
| Excessive alcohol      | ✓ Reduce alcohol intake.  
  ✓ For women: less than 10 drinks per week and no more than 2 a day.  
  ✓ For men: less than 15 drinks per week and no more than 3 a day. |

Prevent a fall

A person who has had a stroke can be at higher risk for falls. The good news is that falls can be prevented. You are at a risk for falling if you have:

- poor balance
- decreased muscle and bone strength
- reduced vision or hearing
- unsafe conditions in and around your home

You can help prevent falls by making changes to your home and lifestyle.

Bathroom

- Make sure that you have non-slip surfaces in the tub or shower.
- Install grab bars by the toilet and bath if you need them to help you sit and stand. Make sure they are well anchored.
- Use a raised toilet seat, and a bath seat in the shower, if you need them.
- Wipe up moisture or spills right away.

Living room and bedroom

- Reduce clutter! Get rid of loose wires and cords as well as any other obstacles.
- Consider using a cordless phone to avoid rushing to answer.
- Have good lighting throughout the house and install night lights.
- Make sure the path is clear between the bedroom and bathroom.
- Scatter mats are tripping hazards. Get rid of them or make sure they are non-slip.
- Move slowly out of your bed or chair. Getting up suddenly can make you dizzy.
Sex and intimacy

After a stroke, you may experience changes that can affect your sexual relationships and intimacy. Some of these changes include:

- fatigue, depression, fear
- lost feeling on one side of your body
- difficulty communicating with your partner
- changes related to obtaining an erection, vaginal dryness

It is up to each person to decide when to return to having sex based on their own readiness.

If you have questions about intimacy or need to talk about it, please speak with your health care provider.

Return to work

Returning to work is an important goal for some people who were working before their stroke.

Stroke affects everyone differently, and recovery is different for each individual. A successful return to work starts with understanding how the effects of your stroke may impact you at work.

If returning to work is important to you, talk to your doctor and rehabilitation team. Getting medical clearance is recommended to make sure that you are able to do your job safely.

It is also important to contact your place of employment as there may be services that can help you return to work. There may also be services available for you if you cannot return to work.

Risk factor | What you can do....
---|---
High cholesterol | ✓ Aim for an LDL cholesterol level less than 2.0.
Diabetes | ✓ Keep your blood sugars within the normal range.
| ✓ If you have diabetes, see your family doctor every 3 months to have your bloodwork checked.
| ✓ Aim for a 3 month average blood sugar, also called Hemoglobin A1C of less than 7%.
Food choices | ✓ Healthy food choices can improve your blood pressure, cholesterol and weight, decreasing your risk for stroke. See pages 9 to 10 for more information.
Exercise | ✓ Include at least 30 minutes of exercise most days of the week.
| ✓ Regular exercise can lower blood pressure, cholesterol and improve your blood sugars.
Stress | ✓ Identify your stressors, be active, make time for yourself, and laugh often.
| ✓ Try to find a balance in your work, personal time and activities.
| ✓ Find someone you can talk to. This is an important way to reduce stress.
Atrial fibrillation | ✓ Atrial fibrillation is a type of irregular heart beat that can cause blood clots to form in the heart. These clots can travel to the brain and cause a stroke.
| ✓ If you have atrial fibrillation, you may be started on a medication to prevent blood clots from forming in the heart. This medication is called an anticoagulant.
| ✓ It is important that you take this medication as directed by your health care provider.
Medications

When you have had a stroke or a TIA, medications will help you recover and help to prevent another stroke. Medications have good effects and possible side effects. If you have side effects, they usually happen when you begin treatment or when a dose is increased.

Most side effects will go away once your body gets used to the medication. Talk to your doctor or pharmacist about how to manage side effects before you decrease or stop taking prescribed medications.

Tips

- Keep an updated list of your medications in your wallet. Know the names of your medications, the dosage and when you take them.
- Take your medication according to the directions on the label.
- Take your medication at the same time each day, such as with breakfast or at bedtime.
- Do not stop taking medication without checking with your doctor.
- If you forget to take your medication, do not double the dose. Call your pharmacist for directions on what to do.
- If you take medication to lower your blood pressure, sit at the side of the bed and dangle your legs before getting up to avoid feeling dizzy.
- Taking “over-the-counter” medications can interact with your prescribed medication. Check with your doctor and pharmacist before taking vitamins, supplements, herbal medicine, cough and cold medications, pain relievers and all other over-the-counter medications.
- Pill organizers such as pill boxes, dosettes, and blister packs, can be useful.
- Do not share your medications with anyone else and do not take anyone else’s medications.
- Use the same pharmacy for all of your medications.

Depression

Depression is a normal reaction to a major life change. Here are some key points about depression:

- Up to half of all people who have had a stroke will have some degree of depression
- Changes in the brain from the stroke can cause depression
- Sometimes depression happens right after a stroke or not until weeks or months later
- Symptoms of depression can vary from mild to severe

Symptoms of depression include:

- Appetite and weight changes
- Memory and concentration problems
- Lack of interest in activities of daily living (such as caring for yourself or household chores)
- Lack of interest in preferred activities (such as spending time with friends, watching favourite TV shows, or doing hobbies).
- Headaches, chronic pain, digestive problems
- Feeling worthless
- Feeling sad, anxious, guilty, irritable or hopeless
- Withdrawing from others
- Trouble sleeping
- Always feeling tired

Treatment for depression includes medication and counselling:

- In most cases, medication does work and can take up to 6 weeks before you notice a change
- Continue to communicate with your care provider (family doctor, social worker or counsellor)
- Having proper rest and meals will aid in having the energy you need for your recovery
- Explore local support groups and services. For more information on support and services in your area visit www.ontario.cmha.ca or www.marchofdimes.ca
- Depression that is treated improves recovery and survival
Fatigue after stroke

Fatigue or feeling tired is one of the most common effects of a stroke and can range from mild to severe. It has been described as the most difficult or upsetting problem that people are dealing with after stroke. You are more likely to experience fatigue after a stroke than a TIA.

Tips to help manage fatigue:

- Give yourself plenty of time to complete activities or tasks; the more you push yourself the worse you are likely to feel.
- Do not try to do all of the things that you used to do and at the same speed. Pace yourself – start off doing less for a while so that you may slowly and steadily attempt to build stamina.
- Take breaks before or after activities. Even tasks that do not require much energy can make you feel tired such as riding in a car or eating a meal.
- Try not to push yourself if you are having a better day. You may feel exhausted the next day or longer.
- Listen to your body; rest during the day if you need to.
- Maintain some level of exercise. Go for a short walk or use a stationary bike for a few minutes. Being active may help improve fatigue.
- Make healthy food choices (see pages 9 to 11).
- If you are able to return to work after stroke, it may be helpful to start with less hours at first. Slowly build up to your regular work schedule as tolerated.

Make healthy food choices

- Eat mostly plant-based foods daily such as:
  - vegetables and fruit
  - legumes (such as kidney beans, black beans, chick peas and lentils)
  - nuts, nut butters and seeds (unsalted)
  - whole grains such as whole grain bread, brown rice or pasta, couscous, quinoa, barley, bulgur and wheat berries
- Eat fish a few times a week.
- Choose white meat such as chicken or turkey. Limit red meat. Avoid processed or cured meats.
- Include low fat dairy products such as milk, milk alternatives (fortified soy beverage) or yogurt daily.
- Limit cheese to portions the size of your thumb.
- Include healthy oils such as olive oil or canola oil.
- Limit sweets to once a week or less.
- Avoid soft drinks and juice. Drink water when thirsty and eat fruit instead.

What do healthy servings look like?

Before you put food on your plate, in your mind divide your plate into 4 equal parts:

- Fill ½ of your plate with vegetables (such as broccoli, asparagus, green beans, carrots, lettuce or other green leafy vegetables). Vegetables contain fibre, plenty of vitamins and minerals, and are low in calories.
- Fill ¼ of your plate with whole grains or starchy vegetables such as potatoes (white or sweet) or corn.
- Fill the other ¼ of your plate with protein foods such as fish, lean meats, eggs, and meatless protein choices like legumes (such as kidney beans, black beans, chick peas or lentils) or tofu.
- Have a glass of water, milk or milk alternative (fortified soy beverage) and a piece of fruit to complete your meals.
Use this picture as a guideline to help you keep healthy servings on your plate.

![Image of a balanced plate with sections for vegetables, fruit, whole grains or starchy vegetables, water, milk or milk alternative, and protein foods.]

**Fibre**

Did you know most Canadians get ½ of the fibre they need every day? In general, adults should get 25 to 38 grams each day.

To increase your fibre include whole grains, fruits and vegetables, oats, oat bran, ground flax seed, psyllium, and dried or canned legumes such as kidney beans, black beans, chick peas or lentils.

**Salt**

Limit your intake of salt (sodium).

Most of the sodium in your diet comes from processed foods and restaurant or take-out meals. Adults should have less than 2000 milligrams (mg) of sodium each day.

**Nutrition Facts Table**

It is important to read the Nutrition Facts Table labels to find out the sodium content of foods.

1. Look at the serving size at the top. Compare this amount to the amount that you eat.
2. Look at the milligrams of sodium. Choose foods with less sodium.

Soup #3 has the least amount of sodium (milligram or mg) for each 1 cup (250 ml) serving.

The best thing you can do is to eat unprocessed and homemade foods more often. That way you control the sodium!

Use herbs, spices and lemon juice instead of salt containing seasonings to flavour food.

- reduced vision or hearing
- unsafe conditions in and around your home

You can help prevent falls by making changes to your home and lifestyle.

Bathroom

- Make sure that you have non-slip surfaces in the tub or shower.
- Install grab bars by the toilet and bath if you need them to help you sit and stand. Make sure they are well anchored.
- Use a raised toilet seat, and a bath seat in the shower, if you need them.
- Wipe up moisture or spills right away.

Living room and bedroom

- Reduce clutter! Get rid of loose wires and cords as well as any other obstacles.
- Consider using a cordless phone to avoid rushing to answer.
- Have good lighting throughout the house and install night lights.
- Make sure the path is clear between the bedroom and bathroom.
- Scatter mats are tripping hazards. Get rid of them or make sure they are non-slip.
- Move slowly out of your bed or chair. Getting up suddenly can make you dizzy.
**Kitchen**
- Store kitchen supplies and pots and pans in easy-to-reach locations.
- Store heavy items in lower cupboards.
- Use a stable step stool with a safety rail for reaching high places.
- Always wipe up any spills right away to prevent slipping.
- If you use floor wax, use the non-skid kind.

**Stairs**
- Make sure your stairs are well lit.
- Have solid handrails on both sides of the stairway.
- Remove your reading glasses when you go up or down the stairs.
- Never rush up or down the stairs. It is a major cause of falls.

**Exterior**
- Keep front steps and walkway in good repair and free of snow, ice and leaves.
- Keep front entrance well lit.
- Put gardening tools such as hoses and rakes away when not using them.

**Eat healthy meals**
- Nutritious meals help keep you strong, fight off colds and flu, and maintain your balance.
- Do not skip meals. It can cause weakness and dizziness.

---

**Learn the signs of stroke**

- **Face** is it drooping?
- **Arms** can you raise both?
- **Speech** is it slurred or jumbled?
- **Time** to call 911 right away

Act **FAST** because the quicker you act, the more of the person you save.

© Heart and Stroke Foundation of Canada, 2017

If you have one or more of these signs, call 911 right away.
What is a stroke?
A stroke happens when blood stops flowing to any part of your brain, damaging brain cells. It is caused by a blockage of blood flow to the brain or the rupture of blood vessels in the brain. The effects of a stroke depend on the part of the brain that was damaged and the amount of damage done.

Types of stroke

Ischemic stroke
This type of stroke is caused by a blockage or clot in a blood vessel in your brain. The blockage can be caused when a substance called plaque builds up on the inside wall of an artery.

Hemorrhagic stroke
This type of stroke is caused when an artery in the brain breaks open. The interrupted blood flow causes damage to your brain.

Transient Ischemic Attack (TIA)
A TIA is caused by a small clot that briefly blocks an artery in the brain. It is sometimes called a mini-stroke or warning stroke. The symptoms of a TIA are similar to a stroke. No lasting damage occurs, but TIAs are an important warning that a more serious stroke may occur soon.

Keep fit
Do some activity every day. It is your best defense against falls.
- Walk. Try Tai Chi. Do what you can to maintain your flexibility and balance.
- Build your muscle and bone strength by doing "resistance" activities or exercises (such as weight lifting).
- Talk to your doctor before starting an exercise program. Have your hearing and vision checked regularly.

Use medication wisely
- If your medication causes dizziness or sleepiness, adjust your activities so you are not at risk of falling.
- Do not mix alcohol and medications. Alone or in combination with medications, alcohol can cause falls.
- See page 8 for more information on medication safety.

Use safety aids
- Wear your glasses and hearing aid.
- Talk to your therapist or family doctor about using a walker or cane. If you use a cane, make sure that it is the correct height and that it is rubber-tipped for safety.
- Wearing the right footwear is important. Comfortable shoes that provide good support can help to prevent falls.
- Find out about other gadgets that can make your life safer. This includes reachers, anti-skid soles, hip protectors, portable phone, or a long handle shoe horn. There are many types of gadgets or devices to help you. Ask your health care provider for more options.
## Tests that may be ordered at your Stroke Prevention Clinic appointment

<table>
<thead>
<tr>
<th>Ordered</th>
<th>Type of test</th>
<th>Purpose of test</th>
<th>How the test is done</th>
</tr>
</thead>
<tbody>
<tr>
<td>☑</td>
<td>CT Scan (Computerized Tomography)</td>
<td>This test shows detailed images of the brain and helps to identify conditions in the brain.</td>
<td>You lay in a scanner that takes picture of your brain using special x-rays.</td>
</tr>
<tr>
<td>☑</td>
<td>CTA (CT Angiography)</td>
<td>To visualize blood flow in the arteries of the brain.</td>
<td>You lay in a scanner and it uses a CT Scan and contrast dye injected into the arteries through an intravenous to take pictures of the blood vessels in the head and neck.</td>
</tr>
<tr>
<td>☑</td>
<td>MRA (Magnetic Resonance Imaging)</td>
<td>This test shows detailed images of the brain and helps to identify conditions in the brain. You may need this if your doctor needs to see areas of the brain that cannot be seen clearly on a CT scan.</td>
<td>You lay still in a scanner and it uses magnetic field and radio waves to produce a 3 dimensional picture of the brain.</td>
</tr>
<tr>
<td>☑</td>
<td>MRA (Magnetic Resonance Angiography)</td>
<td>To visualize blood flow in the arteries of the brain.</td>
<td>You lay in a scanner and it uses magnetic field and radio waves and may or may not require contrast dye to take pictures of the blood vessels in the head and neck.</td>
</tr>
<tr>
<td>☑</td>
<td>Carotid Doppler</td>
<td>To look for a plaque build-up that narrows the arteries in your neck and affects blood flow to the brain.</td>
<td>Uses ultrasound to listen to the flow of your blood through your arteries.</td>
</tr>
<tr>
<td>☑</td>
<td>ECHO Bubble Study</td>
<td>To look at the structure and function of the heart. In particular, this test detects if there is a hole in a wall of the heart.</td>
<td>While an echocardiogram is done, bubbles of sterile salt water are injected into the bloodstream.</td>
</tr>
<tr>
<td>☑</td>
<td>Echocardiogram</td>
<td>To look at the structure and function of the heart.</td>
<td>Uses ultrasound waves to take pictures of your heart.</td>
</tr>

Stroke Prevention Clinic
Your Guide to Stroke and TIA

Contact information
905-521-2100

Stroke Clinic Nurse: Lisa at ext. 46814
Booking Clerk: ext. 44713

You were seen in the Stroke Prevention Clinic because you may have had a stroke or transient ischemic attack (TIA), also called a mini stroke. This can be a stressful time for you and you may have questions about your care. This handout will help to answer some of those questions.

You will receive a letter in the mail with your follow-up appointment. These appointments are usually booked within 3 months after your first visit. If you have any questions in the meantime, or if you have not received your appointment letter, please call the Stroke Prevention Clinic at 905-521-2100, ext. 44713.

For more information on stroke and TIA visit the Central South Stroke Network website at www.csnstroke.ca

Bring this booklet with you to your family doctor’s appointment and to all of your Stroke Prevention Clinic appointments.
